BASOPHILIC LEUKOCYTES.
SUBUNIT: C3 precursor is first processed by the removal of 4 Arg residues, forming two chains, beta and alpha, linked by a disulfide bond. C3 convertase activates C3 by cleaving the alpha chain, releasing C3A anaphylatoxin and generating C3B (beta chain)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      ent receptor 2.";

Immunol Invest 15:365-378(1986).

-i- PUNCTION: C3 PLAYS A CENTRAL ROLE IN THE ACTIVATION OF THE COMPLEMENT SYSTEM. ITS PROCESSING BY C3 CONVERTAGE IS THE CENTRAL REACTION IN BOTH CLASSICAL AND ALTERNATIVE COMPLEMENT PATHWAYS. AFTER ACTIVATION C3B CAN BIND COVALENTLY, VIA ITS REACTIVE AFTER ACTIVATION C3B CAN BIND COVALENTLY, VIA ITS REACTIVE THIOLESTER, TO CELL SURFACE CARBOHYDRATES OR IMMUNE AGGREGATES.
-i- SUBUNIT: C3 PRECURSOR IS FIRST PROCESSED BY THE REMOVAL OF 4 ARG RESIDUES, FORMING TWO CHAINS, BETA & ALPHA, LINKED BY A DISULFIDE BOND. C3 CONVERTASE ACTIVATES C3 BY CLEAVING THE ALPHA CHAIN, RELEASING C3A ANAPHYLATOXIN & GENERATING C3B (BETA CHAIN + ALPHA)
                                                                                                                                                                                                                                                                                                                                         This SWISS-PROT entry is copyright. -!- SUBUNIT: Homodimer.
-!- INDUCTION: By phosphate starvation.
-!- MASS SPECTROMETRY: MW=36413; MW_ERR=18; METHOD=MALDI.
-!- MISCELLANEOUS: Its optimum pH is between 7.25 and 7.75 and temperature is 35 degrees Celsius.
-!- SIMILARITY: BELONGS TO THE D-ISOMER SPECIFIC 2-HYDROXYACID
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             MEDLINE=21264507; PubMed=11278981;

- FUNCTION: THE SMN COMPLEX PLAYS AN ESSENTIAL ROLE IN SPLICEOSOMAL SNRNP ASSEMBLY IN THE CYTOPLASM, AND IS REQUIRED FOR PRE-MRNA SPLICING IN THE NUCLEUS (BY SIMILARITY).
- SUBUNIT: FORMS A STABLE HETEROMERIC COMPLEX WITH SURVIVAL OF MOTOR NEURON PROTEIN (SNN), GEMIN3 AND GEMIN4 (BY SIMILARITY).
- SUBCELLULAR LOCATION: LOCALIZED IN SUBDUCLEAR STRUCTURES NEXT TO COILED BODIES, CALLED GEMS, WHICH ARE HIGHLY ENRICHED IN SUBCESSIONAL SNRNPS. ALSO FOUND IN THE COMPANY.

"NEDO human cDNA sequencing project.";

Submitted (FEB-2000) to the EMBL/GenBank/DDBJ databases.

-i- SUBCELULUAR LOCATION: Integral membrane protein (Probable).

-i- SUBCILULAR LOCATION: ENGRAPANIN (TM9SF) FAMILY.

-i- SIMILARITY: BELONGS TO THE NONASPANIN (TM9SF) FAMILY.

-i- CAUTION: REF 2 SEQUENCE DIFFERS FROM THAT SHOWN DUE TO FRAME.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Sugasawa T., Lenzen G., Simon S., Hidaka J., Cahen A., Gulllaume v. -!- FUNCTION: Reversible hydration of carbon dioxide.
-!- CATALYTIC ACTIVITY: H(2) CO(3) = CO(2) + H(2)O.
-!- COFACTOR: Zinc.
-!- SUBCELLULAR LOCATION: Cytoplasmic.
-!- SUMILARITY: Belongs to the eukaryotic-type carbon
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Lyons P., Marchionni L., Mashima J., Mazzarelli J., Mombaerts P. -!- FUNCTION: CATALYZES THE FIRST STEP IN HEXOSAMINE METABOLISM,
CONVERTING FRUCTOSES 6P INTO GLUCOSAMINE-6P USING GLUTAMINE AS
NITROGEN SOURCE (BY SIMILARITY).
-!- CATALYTIC ACTIVITY: L-glutamine + D-fructose 6-phosphate = L-
glutamate + D-glucosamine 6-phosphate.
-!- SUBCELLULAR LOCATION: Cytoplasmic (By similarity).
-!- SIMILARITY: IN THE C-TERMINAL SECTION; BELONGS TO THE SIS FAMI
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        16-OCT-2001 (Rel. 40, Created)
